RELEASE NOTES

COMPASS 4.2.3 UPDATES FOR GALAXY

Compass 4.2.3 software requires the following firmware versions:

- GALAXY Firmware v1.2.4 (All models)

- Bluehorn 816 v1.2.4

- RMServer v2.2.3

- CAL v1.3.3

FIRMWARE UPDATE - FLASH MEMORY HARDWARE

GALAXY units running firmware version 1.2.3 should be upgraded to version 1.2.4, which adds protection from downgrading the firmware to a version that is incompatible with the new hardware. The functionality of 1.2.4 is otherwise identical to version 1.2.3.

CONTROLLER MODES

GALAXY Internal controller mode will only work when making connections to other GALAXY devices. If you wish to connect to a third-party device, you will need to use the external controller mode to make AVB connections.

KNOWN ISSUES

Using an Apple computer with AVB capabilities to make AVB connections to GALAXY will produce unexpected and undesirable results. It is strongly recommended to avoid AVB connections to or from an Apple computer.
